                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Two cDNA clones encoding Leu8 determinants were isolated from a human T cell library using the rapid immunoselection cloning method (see e.g. AAQ21164 for description of method). This protein sequence was deduced from the shorter insert. The weakly hydrophobic C-terminal domain is characteristic of surface proteins that are attached to the cell membrane by covalent linkage to a phosphatidylinositol-substituted glycan.

See AAQ21184 for the larger insert and AAR20815 for the major form of the Leu8 antigen that it encodes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR91443 standard; Protein; 363
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New CD53 cell surface antigen and DNA encoding it - for immuno-therapy and diagnosis of haematopoietic neoplasms,

                       Human T-cell specific Leu8 antigen
                                                                                                                                                                                                                                                                                                                                             2 cDNA clones encoding Leu8 determinants (AAR91442 and AAR91443) were isolated from a human T-cell library using a novel immunoselection cloning method. The longer insert (AAR14723) contained 2,350 residues, while the shorter lacked 436 internal residues. A major transcript of 2.4 kb was present in peripheral blood monouclear cells (PBMC), tonsillar B cells, and several lymphocytic cell lines, and a minor transcript of 2.0 kb in PBMC, Jurkat and HSB-2 leukaemic T-cell lines. Leu8 antigens can be obtd. for diagnostic and therapeutic use. The presence or absence of Leu8 on CD4 T-cell subsets. Soluble forms of Leu8 can act as antiinflammatory agents by reducing tumbhoryte micratics.

                                                                                                                                                                                                                                                             The present sequence is that of a T-cell specific Leu8 antigen, as predicted from 1 of 2 clones (see AAA50632) isolated from a human T-cell library by the method of the invention. A longer Leu8 antigen is given in AAY96138. The method, designed to isolate cell surface antigen (CSA) cDNAs, is based upon transient expression of a CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and immunotherapeutic applications, including the diagnosts and treatment of immune-mediated infections, diseases, and disorders in animals, including humans. These disorders include disorders in animals, including humans. These disorders include call-thma, immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. The ability to interfere with the binding of Leu8-T-cells to antigen presenting cells, or the ability to cause such binding to occur on surfaces other than lymphocyte cells, can be useful in diagnostics and therapy. The level of activated Leu8-T-cells relative to resting Leu8+ cells could serve as a measure of immune response to a particular antigen. Modification of the specificity of the extracellular domain of Leu8, which mediates of Leu8 could act as antiinflammatory agents by reducing lymphocyte contrartion.
                                                                                                                                                    Query Match

                                                                  encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                      A hybrid immunoglobulin chain comprising the ligand binding site of a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the
                                                                                                                                                                                                                                                                           Nucleic acid encoding hybrid immunoglobulin comprising binding site of a receptor fused to Ig constant region diagnosis and treatment e.g. of inflammation
treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                            immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            metastasis

                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                            Š
                                                                                                                                                                                                                                                                                                                                                                        region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and toxins, or as modulators of cell adhesion (e.g. in the immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region

The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the advector (representation of a light block of a control of the combines the advector (representation of a light block of a light block of a light block of the combines the advector (representation of a light block of a light block of the combines the advector (representation of a light block of a light block of the combines the advector (representation of a light block of a l
                                                                                                                                                                                                                                                                               the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful fidingnosis and treatment e.g. of inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Typical applications are as antivital, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile174Leu substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 TWYGTNKSLTEBAENWGDGEPNNKKNKEDCVEIYIKRNKDAGKWNDDACHKLKAALC 117

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Typical applications are as antiviral, neuromodulating and (e.g. in immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Asn181Gln substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.

                                                                                                                                                                 Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful for diagnosis and treatment e.g. of inflammation
Sequence
                                                facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyt cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Thr211Ser substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A hybrid immunoglobulin chain comprising the ligand binding site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 19; 41pp; English.

                                                                                            encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-NOV-1989;

Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. treating graft rejection; inflammation; metastasis of lymphoma et the immunoglobulin component increases plasma half life and
                                                                                                                                                                                                                 immunoglobulin constant region. The receptor is not immunoglobulin super family, nor a multiple subunit polypeptide immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain commonded by discrete genes.
                                                                                                                                                                                                                                                                                                                A hybrid immunoglobulin chain comprising the ligand binding site a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an active transmembrane region.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Ser226Thr substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin; transmembrane receptor; adhesion; targetting; diagnosis; therapy; drug delivery; antiviral; neuromodulator; immunomodulator; cell adhesion; graft rejection; inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful for diagnosis and treatment e.g. of inflammation

```
immunoglobulin super family, nor a multiple subunit polypeptide
cencoded by discrete genes. The hybrid immunoglobulin chain combines
ceffector functions of a ligand binding partner (LBP) with the
ceffector functions of immunoglobulin and can bind to activate
more than one ligand. It can be used diagnostically for the in
vitro assay of LBP and their targets; or therapeutically to deliver
LBP such as toxins, enzymes, growth factors to particular cells.
Typical applications are as antiviral, neuromodulating and
treating graft rejection; inflammation; metastasis of lymphoma etc.)
The immunoglobulin component increases plasma half life and
ceffective facilitates purification while deletion of the transmembrane region
ceffectilitates recovery, improves aqueous solubility and removes
potentially immunogenic epitopes. Variants of the human lymphocyte
cell surface glycoprotein described in AAR98106 are given in
                                                                                                                    Matches

```
A hybrid immunoglobulin chain comprising the ligand binding site of a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in the used diagnostically for the in LBP such as toxins, enzymes, growth factors to particular cells.
Sequence
                                       Typical applications are as antiviral, neuromodilating and immunomodilating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22-NOV-1989;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR98123 standard; Protein; 371
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile288Val substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver
                                                                                                          07-MAY-1996
                                                                                                                                                                  US5514582-A
                                                                                                                                                                                                                                                                                                                                                                                                    Binding-site

                                                                                                                                                                                                                                         RESULT 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.). The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in ARR98106. This variant contains a Lys298-Lys299; Arg-Arg
                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                               vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the buman lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile302Leu substitution.

Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful for diagnosis and treatment e.g. of inflammation e.g. of inflammation

Disclosure; Page 19; 41pp; English.

a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral parenchinations. A hybrid a single Typical applications are as antiviral, neuromodulating immunoglobulin chain comprising the ligand binding agents, or as modulators of cell (e.g. site ín of

Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant is a Asn271 deletion mutant.

The largest EcoRI insert (2.2kb) was isolated and sequenced. The ORF codes for 372 amino acids with a mol. wt. of approximately 42.200. Comparison of the HuLHR amino acid sequence with the murine LHR sequence (AAR37961) showed a high degree of amino acid conservation in each of the LHR domains, e.g. 96% in the transmembrane domain and 83% in the carbohydrate binding of lymphocytes to lymphoid tissue to treat inflammation or graft conservation. They could also be used to control lymphoma metastasis
                                                                                      Human; murine; lymphocyte; cell surface glycoprotein; homing receptor; LHR; endothelium; lymphocid tissue; signal; domain; complement binding; carbohydrate binding; epidermal growth factor-like; egf; intracellular transmembrane binding; cytoplasmic; ligand binding partner protein;

                                                                                         Ъ
                                                                                                                                    DЬ
                                                                                                                                                         QΥ
                                                                                                                                                                                                                                                         The sequences given in AAR38908-09 represent human and murine lymphocyte cell surface glycoprotein (LHR) respectively. These proteins mediate the binding of lymphocytes to the endothelium of lymphoid tissue. LHR is a glycoprotein which contains a signal domain, a carbohydrate binding domain, an epidermal growth factor-like (egf) domain, at least cone complement binding domain repeat, a transmembrane binding domain (TMD) and a charged intracellular or cytoplasmic domain. The murine and human amino acid sequences show a high degree of overall homology (83%), however degrees of homology between the various domains is variable. These proteins may be fused to a ligand binding partner protein (LBPP) which causes an increase in the half life of the LHR. The fusions may be used therapeutically to compete with the normal binding of lymphocytes to lymphoid tissue. They may be used in organ or graft rejection and for the treatment of inflammation.
                                                                                                                                                                                 Matches
                                                                                                                                                                                             Query Match

             A murine Mel 14 antigen cDNA clone was used to screen a lambda gtl cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells. A cDNA clone encoding LHR was isolated.
                                                                       New hybrid ligand binding constant region sequences half-life

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A mouse LHR (lymphocyte cell surface glycoprotein) cDNA clone was us to screen an oligo-dT primed lambda gtl0 cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells. A 2.2 kb clone (sequence given in AAT05869) was isolated that encoded human LHR protein (AAR83050). LHR-IgG hybrids were constructed for in the targeting of therapeutic moleties to lymphoid tissue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subnit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                        Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a 209-Asn insertion.
                                                                                                                                                                                                                                                                                      immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-NOV-1989;

The sequence is that of a human lymphocyte homing receptor (LHR) which may be used in the construction of a chimeric molecule comprising an LHR fused at its C terminus to the N terminus of an immunoglobulin constant region. This can be used for the prevention of lymphocyte attachment to endothelial cells. Such a method may
                                                                        Prevention of lymphocyte attachment to endothelial cells - using chimeric molecule comprising lymphocyte homing receptor and immunoglobulin constant region

           This sequence is the human lymphocyte homing receptor (LHR) of the invention. LHR is a lymphocyte cell-surface glycoprotein that mediates the binding of lymphocytes to the endothelium of lymphoid tissue. Soluble LHR polypeptides, lacking signal peptide (amino acids 1-38), transmembrane domain (amino acids 33-355) and cytoplasmic domain (amino acids 356-372), can be used therapeutically to compete with the normal binding of lymphocytes to lymphoid tissue and are especially useful for organ or graft rejection treatment protocols, for treating inflammations such as arthritis and other autoimmune diseases, for control of lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lymphocyte arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       be used for preventing organ or graft rejection, for treating inflammatory disorders, e.g. rheumatoid arthritis or other autoimmune diseases, for controlling lymphoma metastasis and for treating conditions in which there is an accumulation of lymphocytes.

               The specification describes a product which antagonizes binding of respiratory synctial virus (RSV) G-protein to annexin II or L-selectin, or causes a decrease in cell surface levels of annexin II or L-selectin. Such products are used in the manufacture of a medicament for use in prevention or treatment of RSV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC A hybrid immunoglobulin chain comprising the ligand binding site of CC a single transmembrane receptor without an active transmembrane (CC a single transmembrane receptor without an active transmembrane (CC region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the communoglobulin super family, nor a multiple subunit polypeptide (CC encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in composer than one ligand. It can be used diagnostically for the in composer than one sasay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or administration; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates precious columnities achieved achieves solubility and removes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chalm combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR99106 are glven in AAR99109-R98135. This variant contains a 292-Tyr-Tyr-Tyr insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A hybrid immunoglobulin chain comprising the ligand binding site a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an

3C B cell-specific cDNA was isolated from a human tonsil cDNA library
3C (ATCC #37546) using differential hybridisation with labelled cDNAs
3C from either B cell(RAJI) RNA or T cell (HSB-2) RNA. Positive
3C plaques were isolated and cloned and the cDNA inserts subcloned into
3C pSp65. One of the 261 RAJI+ HSB2- cDNA clones isolated, B125
3C contained a 1.9 kb cDNA insert that hybridised with a 2.4 kb RNA
3C species found in several B cell lines. However B125 did not
3C tybridise with any of the other RAJI+ HSB- clones or with mRNA from
3C several T cell lines. The B125 cDNA clone hybridised with a 2.3 kb
3C cDNA, termed pLAM-1 (prod. shown). The amino acid sequence of
3C cDNA, termed pLAM-1 (prod. shown). The amino acid sequence of
3C cDNA, termed plam-1 (prod. shown). The amino acid sequence of
3C contained antibodies specific for LAM-1 may be prepd. and are useful
3C in the treatment of inflammation, autoimmune disease, shock, tissue
3C damage, organ or tissue transplant rejection and to inhibit the
3C metastasis and homing of malignant cells which express the LAM-1
                                                                                                                                                                                                                                                                    Monoclonal antibodies to leukocyte adhesion molecule-1 useful for treating inflammation, cancer, auto-immune citissue damage and organ or tissue transplant rejection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cDNA encoding the LAM-1 protein was isolated from a human tonsil cDNA library (ATCC 37546). The mature LAM-1 protein has an extracellular region of about 294 amino acids containing 7 potential N-linked carbohydrate attachment sites. LAM-1 has a cytoplasmic tail of 17 amino acids containing 8 basic and 1 acidic residues. The processed LAM-1 protein has a Mr of at least 50,000. LAM-1 combines domains homologous to domains found in three distinct families of molecules: animal lectins, growth factors, and C3/C4 binding proteins.
This sequence represents L-selectin. The lectin domain of L-selectin may be used in the construction of the new bifunctional ligand-binding polypeptide of the invention. These peptides have leucocyte mobilising activity for treating tissue damage, autoimmune disease, post-reperfusion injury or organ/tissue transplant rejection. They act by interfering with binding of leucocytes at the site of inflammation and also inhibit platelet and mononulcear cell
                                                                                                                                                           New bifunctional polypeptide contg. binding domains of different selectin - and related DNA useful as leucocyte mobilising agents for treating autoimmune disease, post-reperfusion injury etc., also for targetted drug delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                L-selectin; lectin domain; bifunctional; ligand-binding polypeptid leucocyte; mobilising activity; tissue damage; autoimmune disease; post-reperfusion injury; organ/tissue transplant rejection; inflammation; inhibition; platelet; mononulcear cell; aggregation;
